

Air Filter Preventative Maintenance Record

Check Filter Minder[®] Indicator to determine air filter restriction

- Record filter data on chart, change filter when yellow position indicator reaches red zone, and reset indicator.
- On rare occasions, a wet filter from rain or snow may cause a large increase in filter restriction or red zone reading. To verify dry filter restriction, reset the indicator and road test. If the position indicator returns to the red zone, change filter and reset indicator. The history of filter readings will help identify anything unusual.

Note: Air filters usually have low restriction for most of their life, then restrict rapidly at the end. Filter service life of 200,000 to 300,000 miles is common on class 7 and 8 trucks.
